## Cartomap 6.2

Kannabirina "Émigré" app pdf Ba. Cartomap 6.2. Version 6.2 (More than 10 years old)Q:

AsyncTask and object returned by method I have the following function that returns a connection object which I store in a class member. private Connection getInformacion(String url, Object[][] datos) throws Exception { AsyncHttpClient client = new AsyncHttpClient(); client.get(url, new AsyncHttpResponseHandler() { @Override public void onSuccess(int statusCode, Header[] headers, byte[] responseBody) { // do something } @Override public void onFailure(int statusCode, Header[] headers, byte[] responseBody, Throwable error) { // log error } }); // Do something with the responseBody } The problem is that when I call this function with an URL that returns only 0 rows, the application hangs, something like this: long c = 0; do { c = getInformacion("", new Object[][] {}); } while(c == 0); Is there any kind of wait for "onSuccess" to be able to continue or something similar? Any help will be very appreciated. A: what you are doing here is a blocking call which prevents your code from executing the remaining statements. On success, you call something but instead of executing the remaining statements, you just return, so you don't get to the next statement until onSuccess is executed. You should move your do-while loop to another thread and use a Executor. for example: Executor executor = Executors.newFixedThreadPool(1); // launch thread pool, and pass url, object[][] arrays // to new Connection calls executor.execute(new Connection d0c515b9f4
