

Q: Return an object property as a function parameter? How do I return an object property as a parameter? For instance, how do I make this work? `function success(data) { return data.name }` I tried using the new keyword like so, but it didn't work: `function success(data) { return new data.name }` A: You just have to use the proper ES6 notation. `function success(data) { return data['name'] }` Other options for you will be using `Array#find` or `Array#findIndex`. The `Array.prototype.find()` method returns the index of the first element in the array that satisfies the given test. -MDN `Array.prototype.find()` The `Array.prototype.findIndex()` method returns the index of the first element in the array that satisfies the given test. -MDN `Array.prototype.findIndex()` Q: Why would you use a * to dereference a pointer to an object? I'm trying to wrap my head around pointers and am confused about their use. I have two questions that are related: When would you use the * operator to dereference pointers? (what does * do in this context? Can you explain the following line of code by breaking it down: `*&pv = v`; Thanks! A: This is a pretty cool approach of understanding pointer arithmetic! Here is another way of thinking about what your loop is doing: The increment operator `++` is essentially equivalent to increment the pointer by 1. Pointers are numbers Pointer values are used to address variables in memory. Memory is addressed using integers. In C, you can think of an integer (int) as a pointer: `int i = 1; //this is referencing the integer variable called i int *j = &i; //this is referencing the address of the i variable` So, what does `&i` mean? It means get the memory address of `i`. Memory addresses are numbers So, `&i` becomes a pointer called `j`: `int i = 1; int *j = &i; //j is a pointer to`

Windows 7 Ultimate [32bit + 64bit][EUC][AVI] 20.10.6.893 + Patch Kaspersky Internet Security 2017 + Crack. Download: SOFTPEDIA - Kaspersky Internet Security 2017 Crack & Patch Professional. IObit Driver Booster Crack 12.9.5.620 (64 Bit) [1.1.03.2] by mbalmer.Q: Kotlin - Any operator overloading? I was just wondering if I could overload any/all operators in Kotlin so that it would behave like it does in C#. For example I have this class in C# and I want to basically write the same thing in Kotlin, but I want to be able to do this. public class DateTime { public DateTime(DateTime original) : base(original.ToString()) { } public static implicit operator DateTime(int value) { return new DateTime(value); } //Whatever else } A: The closest thing to overloading operators in Kotlin is extension functions, which are functions that are added to the class and can be overloaded like functions: class DateTime { operator fun toString(): String = toString() private val staticDate: Date = Date() } fun DateTime.toString(): String = staticDate.time val date = DateTime(123) println(date.toString()) // prints: 23:09:43 Q: How do I get the list of network adapters through PowerShell in Windows Server 2008 R2? I'm trying to get the list of network adapters (network controllers) from a list of servers running Windows Server 2008 R2. Is there a PowerShell command that can do this? A: You will need to iterate over each interface to get the list of network adapters (network controllers) for each interface on the given computer. You can use this script and that command from this answer to enumerate interfaces with Powershell. \$computers = gwmi Win32_NetworkAdapterConfiguration | where {\$_.IPEnabled -eq "True"} foreach (\$computer in \$computers) { \$computer_name = \$computer. @{Name='ComputerName'} \$computer_pdc = \$computer. @{Name='PDC'} \$computers = \$computer_
