

On the "My Account" page, there was a section called "Shop" and it had a drop down menu called "Reset". This was a link to the page you had selected on the SSC site to reset your printer. For each button or button combination that you had pressed, there is a reset button in the "Shop" page of the My Account page. After selecting the button that you wanted to reset, you had to scroll down and press the reset button. This process took about 45 minutes. Once we finished our reset (it only made 2 colors black and cyan), the print quality on our page quote and ink price website returned to normal. Epson does not call this a malfunction, and instead is called an In-Home Job. This simply means that your printer was reset to default settings. You do not need to send it to Epson to fix, instead you can reset it yourself. This is a useful feature for owners of new and used Epson printers, as you can try new models and see how your printer does. With a working Epson Artisan 800, also a CI system, I was able to reset the printer five times (from 519 total prints) using the WIC reset key. When I reset it for the first time, the page count was totally normal, and the first page was actually ok. The second page was totally messed up, with only the top half of the page printing. I thought this was odd, because the page count read 519 (as it always has since printing began in 2010), but the number of prints for the first page was only (was blanked out and the smudged out, so I wouldn't know for sure). There was NO ERROR message, however, it simply sat there doing nothing. I was able to navigate to and print the next page, and it was fine. The third page showed the same problem as the second page. Then, the fourth page was completely, totally messed up, with every page being covered by smudges and it was super hard to read. It would not print any pages after that, and this is when the printer went kaput. That was the print count on this printer as of 8/16/16 at around 4pm. We also found out that if the print count is greater than about 8k pages, the printer will eventually stop printing, regardless of the settings for that printer. If I reset after hitting about 5k pages, the printer would print for a little while before stopping. If I reset after hitting 20k pages, the printer would print for about 10 minutes before stopping. I do have a feeling that the memory chips are slowly becoming damaged, so it may have to be this way. Then, the fifth page was fine, as if nothing ever happened. I don't know if this fifth page was actually a print or a total reset, but I would guess a reset since the print count was about 1.4k, which is so close to the normal maximum that it just couldn't print anything. Anyway, I did read that you may have to print a few full page prints to reset - however, I did not read if you could do this with just one page. At any rate, I would still recommend that you do a WIC reset to see if that fixes any problems with your Epson Artisan 800. I don't know if I should even be mentioning all of this in this article (I was going to reveal more of the secrets, then I thought a lot of them are not secrets at all, just bad settings). However, I guess I should mention that I did literally break the printer at this point. I squeezed the reset button until it broke. A couple of days later, it would not reset after being turned on at all. I was so annoyed that I just gave up on it. I really don't think that there is a problem with the printer itself, however, the reset button is so flimsy that it just broke off when I squeezed it, and I didn't think that I could put that back on without a \$30.00 part. I looked it up in Epson's website, and found that the part was about \$10.00. I looked up the connector pin numbers in the instructions, which I had printed out (along with the manual), and the connectors were just falling off. Literally. Anyway, I replaced them with replacement parts (with the same pin numbers), but it was actually the same connector that I had before. When I connected it back up, it was the same connector that I had before. It was just one connector. And that's what my printer looks like.

We restarted the printer and the same error message came up. We tried resetting the print head (ink) by connecting to the printer, and just waiting a few minutes. We then performed the following steps: Step 1: Disconnect the printer from the network and power off. Step 2: Connect the USB cable from your computer to your printer. Step 3: Disconnect the printer from your computer. Step 4: Plug the AC adapter or battery into your printer. Step 5: Power on your printer. Step 6: Click "Reset Print Head" or "RESET / Full" if using a WF-4630. Step 7: You will see the "Ink Sensor Reset OK" message. Step 8: Press the "Clear Ink Level" button on the printer. You will see the "Ink Level OK" message. Step 9: Disconnect the printer from the power source and power cycle the printer. Step 10: If needed, manually recharge the ink jet cartridges, and try printing again. Step 11: Restart the printer. Step 12: Plug the printer back into the network and the printer's own network IP Address. Step 13: You will be prompted to enter your remote access user name and password. Step 14: Open a web browser and navigate to the IP Address of your computer. Step 15: You will be greeted with a new "Welcome to xxxx Network" message. Congratulations, you have just reset the WF-4630 to factory settings. Step 16: Remove any Epson ink jet cartridges from your printer. 5ec8ef588b
